INSTALLATION QUICK GUIDE

FENCING INTO GROUND

FENCING INTO GROUND INSTALLATION QUICK GUIDE

saige ENGINEERED FOR THE OUTDOORS

Tools & Safety Information

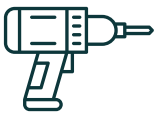
No specialist tools are required when working with Saige composite products. However for the best results, we recommend using carbide tipped blades when using a mitre saw, we recommend a 10"-12" saw blade with 30 teeth or less. Saw blades with fewer teeth stay cooler and last longer.

If using a power tool, we advise to adjust the tool so that the screws are not over tightened. Take normal safety precautions when working with timber products. Wear gloves to avoid splinters and a nose and mouth mask when cutting to avoid the inhalation of dust.

Always wear goggles (and ear protection) when using circular saws, drills or sanders and always use an RCD device when using any power tools outside.

Tools you may required:

Mitre Saw



Drill/Driver

Phillips Screw driver

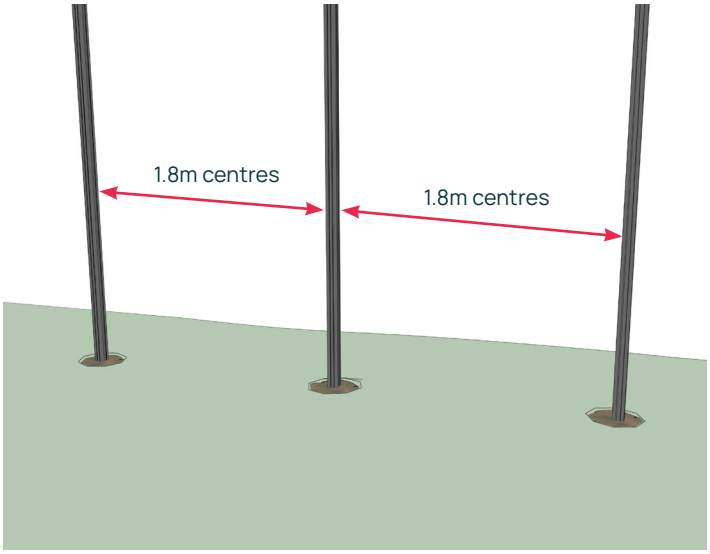
Tape Measure

Hammer

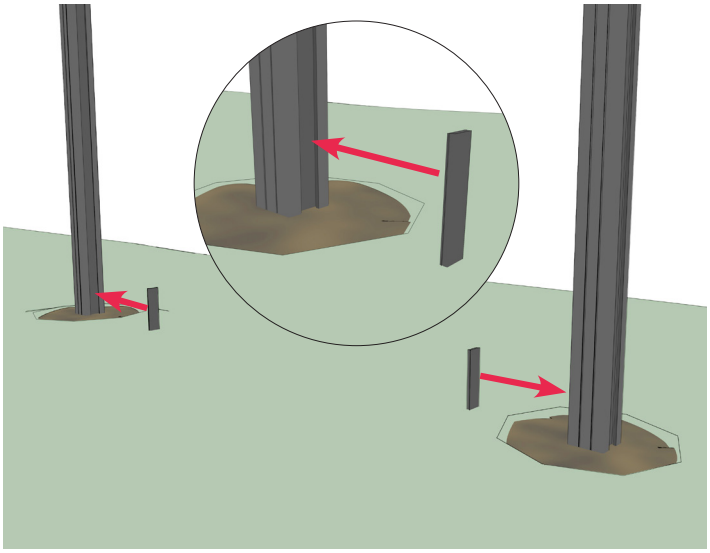
Pencil

drill bit

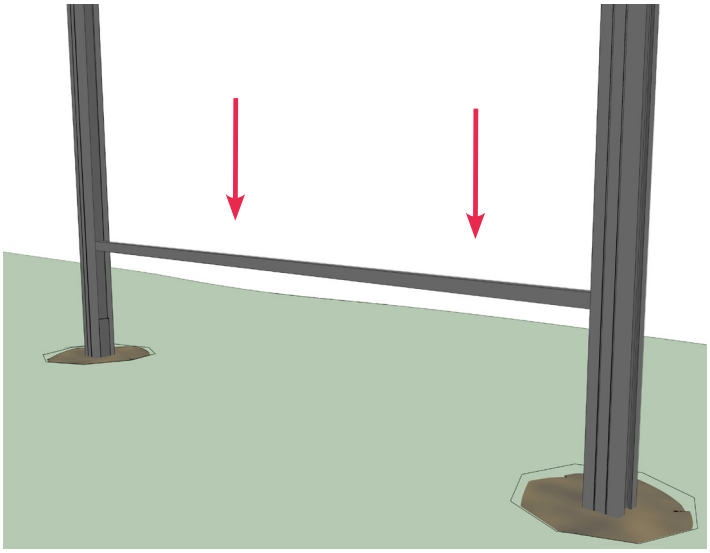
Spirit Level



1. Dig sufficient holes and concrete posts into place, embed at least 600mm of post into the ground. Note: Use bottom rail as measure to the next post,before concreting in the next post in the run.

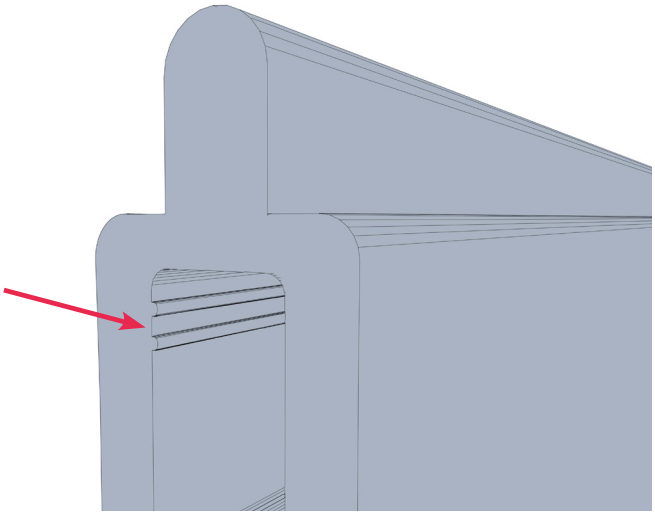


3. Insert 55mm insert into each post.

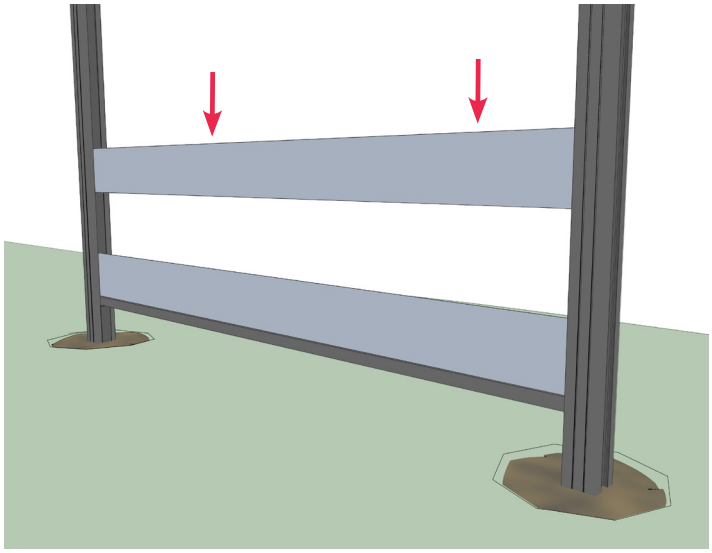


4. Install bottom rail.

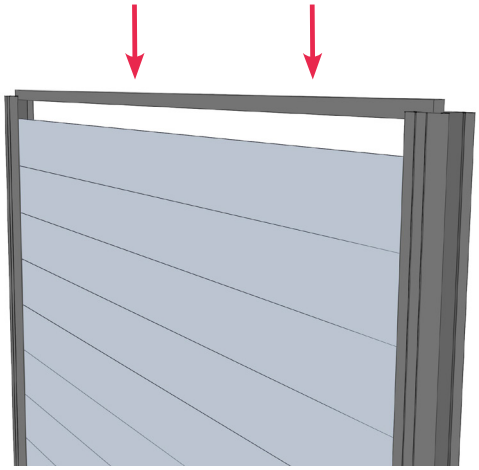
FENCING INTO GROUND INSTALLATION QUICK GUIDE



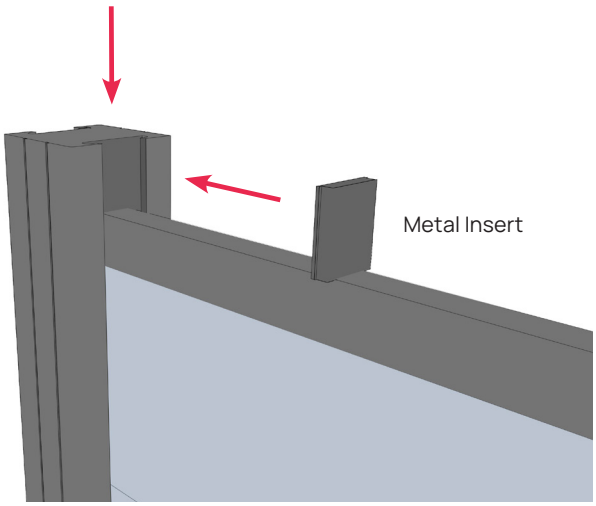
5. When inserting the fencing panels make sure they are all front facing. The front can be identified by ensuring the two raised notches on the inside of the top cutout are facing forwards.



6. Insert fencing panels. Make sure the identifying rib is facing the front. Continue inserting fencing panels until you have reached your desired height.
Note: Make sure the fence panels are seated together correctly.



7. When you have reached your desired height insert the top rail.



8. Add a sections of the metal insert to both posts to stop the top rail being able to move.
